

30302 - Circuits and systems

Información del Plan Docente

Academic Year	2018/19
Subject	30302 - Circuits and systems
Faculty / School	110 - Escuela de Ingeniería y Arquitectura
Degree	438 - Bachelor's Degree in Telecommunications Technology and Services Engineering 330 - Complementos de formación Máster/Doctorado 581 - Bachelor's Degree in Telecommunications Technology and Services Engineering
ECTS	6.0
Year	XX
Semester	Indeterminate
Subject Type	Basic Education, ENG/Complementos de Formación
Module	---

1.General information

1.1.Aims of the course

1.2.Context and importance of this course in the degree

1.3.Recommendations to take this course

2.Learning goals

2.1.Competences

2.2.Learning goals

2.3.Importance of learning goals

3.Assessment (1st and 2nd call)

3.1.Assessment tasks (description of tasks, marking system and assessment criteria)

4.Methodology, learning tasks, syllabus and resources

4.1.Methodological overview

The teaching methodologies that will be applied in order to achieve the proposed learning goals are the following:

The course is taught using a marked practical approach, by applying Problem Based Learning (PBL) strategies: raising problems and looking for solutions. During this process, the students'critical spirit and self-assessment is encouraged.

30302 - Circuits and systems

Fundamentals of circuits and systems are presented and explained in participative lectures, while the laboratory sessions, seminars and assignments are more focused on the experimental perspective and the capacity to address new situations or problems. It is noteworthy that the laboratory sessions are face-to-face activities and their assessment contribute to the final grade of the course.

4.2. Learning tasks

The following types of activities are scheduled:

APA1. Participative lectures, where the main course contents are presented and discussed.

APA2. Problem solving, where different activities/tasks are proposed related to the main contents of the course.

APA3. Laboratory sessions, seminars and assignments, where students can put into practice the theoretical part of the course and are aware of its application to real-world telecommunications.

4.3. Syllabus

PART 1

Unit 1. Basic concepts of circuits and systems. Circuit variables: charge, current, voltage and power. Ohm's law, active and passive circuit elements: independent sources, dependent sources, resistors, capacitors, inductors. Systems and properties.

Unit 2. Basic laws and circuit theorems. Concept of node, branch and loop in a circuit. Kirchhoff's laws. Source Transformations. Superposition. Thevenin's and Norton's theorems.

Unit 3. Nodal and mesh circuits analysis. Two-port networks. Nodal analysis. Mesh analysis. Two-port networks: parameters

PART 2

Unit 4. Time response of first-order circuits. Introduction. First-order circuits. Unit's step function. Exponential Response. First-Order Circuits. Step Response. Transient Analysis. Steady-State Analysis.

Unit 5. Circuits in the s-domain. Network function. Circuit elements in the s-domain. Impedance and admittance. s-domain circuit analysis. Circuit poles and zeros and relation to natural and forced response. Sinusoidal steady-state analysis and frequency response. Phasors and sinusoids. Complex power. Maximum power transfer.

4.4. Course planning and calendar

30302 - Circuits and systems

The course calendar is determined by the Escuela de Ingeniería y Arquitectura calendar. In addition, the main dates of the course will be informed through the Moodle platform of the University of Zaragoza.

4.5. Bibliography and recommended resources
