4.1.Methodological overview

The methodology followed in this course is oriented towards the achievement of the learning objectives. A wide range of teaching and learning tasks are implemented, such as:

- Lectures: participatory lectures where the basic principles that enable students to meet the physical, chemical, biochemical and microbiological characteristics of raw materials and processed food as well as the general processes of production, preparation, conservation and/or processing of food be established. Also, the methods of analysis of the parameters that determine the quality of such foods will be studied.
- Practice sessions in the laboratory and in the pilot plant where students become familiar with the methods of analysis of foods, with their quality parameters and with the equipment used for storage and processing.
- Seminars, which will allow us to deep in various aspects of food preservation: calculation, adjustment and optimization of thermal processing and needs for refrigeration and freezing.
- Mentored or academically directed group work: the knowledge and skills acquired in the course will be integrated with a group work in which students will describe the method/methods for the conservation of a particular food, its formulation and legal requirements to which it is subject. Besides the necessary analyzes be conducted to determine what meets the quality criteria established by law.

All materials and resources used in teaching will be available in the Digital Teaching Ring that the University of Zaragoza

offers students and teachers (<http://add.unizar.es>)

4.2.Learning tasks

The course includes the following learning tasks:

- 28 hours of lectures (participative lectures)
