

Academic Year/course: 2021/22

29616 - Strength of Materials

Syllabus Information

Academic Year: 2021/22

Subject: 29616 - Resistencia de materiales

Faculty / School: 110 - Escuela de Ingeniería y Arquitectura

Degree: 430 - Bachelor's Degree in Electrical Engineering

ECTS: 6.0

Year: 2

Semester: Second semester

Subject Type: Compulsory

Module:

1. General information

2. Learning goals

3. Assessment (1st and 2nd call)

4. Methodology, learning tasks, syllabus and resources

4.1. Methodological overview

The learning process designed for this course is based on the following items:

Continuous evaluation with reviewable intermediate milestones and an individual or team project

Besides the bibliographical resources available and mentioned in this introductory guide, several additional resources will be used, namely:

- * Powerpoints and hand-outs of the course
- * Additional documents uploaded in the ADD of the course

4.2. Learning tasks

The course program offers the student the next activities designed to help him in achieving the planned results and competences

The course will be developed along the semester as a collection of the following activities:

- 1. Theory lectures (T1). In them, the main scientific body of the course will be exposed and several examples of applications will be presented.
- 2. Exercise lectures (T2). These lectures are designed to complement the T1 activities, allowing the student to fix and apply the concepts introduced as well as to face and resolve simple but realistic problems in the field engineering practice.
- 3. Lab practices (T3). These practices are designed to get the student closer to the experimental reality, to recognize and use some of the usual equipment in real practice to measure stress-strain variables and, finally, to test the validity and accuracy of the assumptions and results explained in T1 and T2.
- 4. Simulation practices (T4). The aim of these practices is to present the student another essential tool in engineering practice, as it is numerical computing and physical simulation in deformable solid mechanics. The main practical objectives are to become familiar with update software for mechanical simulation and to learn how to

criticize the results obtained in the computer, detecting errors and assessing the validity and accuracy of the obtained results.

- 5. Course project (T5). Here, the idea is to promote the formula of project-based learning to reinforce and fix the learning results of the rest of the activities, as well as to improve the competence of teamwork, together with T3 and T4. Finally, these projects will allow the student to improve his skills in searching relevant information in the field and take decisions with insufficient information.
- 6. Mentoring. Individual contacts between teacher and student help in fixing particular aspects and solve doubts derived from the different teaching activities.

4.3. Syllabus

The course will address the following topics:

- 1.- An introduction to the Strength of Materials
- 2.- Tension and Compression
- 3.- Stresses in Transversally Loaded Beams
- 4.- Torsion of Circular Shaft
- 5.- Buckling
- 6.- Simplified Design of Steel Structures

4.4. Course planning and calendar

Schedule of on-site lectures and presentation of projects

The T1 and T2 lectures, as well as T3 and T4 practices, will be developed according to the schedule established by the School of Engineering and Architecture, which are published prior to the beginning of the course.

The course project will have to be delivered prior to the official date of the course exam established by the School of Engineering and Architecture.

Each teacher will inform about the schedule of mentoring sessions.

4.5. Bibliography and recommended resources
