

Academic Year/course: 2021/22

30039 - Industrial Edification

Syllabus Information

Academic Year: 2021/22

Subject: 30039 - Edificación industrial

Faculty / School: 110 - Escuela de Ingeniería y Arquitectura

Degree: 436 - Bachelor's Degree in Industrial Engineering Technology

ECTS: 6.0

Year: 4

Semester: First semester

Subject Type: Optional

Module:

1. General information

1.1. Aims of the course

The aim of the course is to learn general aspects of the industrial construction, its construction technology, its typological and constructive implementation, and the layout of facilities related to the manufacturing process within the building and the industrial plot.

To this end, it is analysed the historical evolution of industrial architecture, along with the development of the manufacturing processes, materials, and technologies available for construction. In turn, the main types of industrial activities are described, as well as the characteristics of its industrial buildings and auxiliary spaces.

The analyses of the business needs, the most important regulations for the plant layout, and the distribution of industrial plot, are also part of the themes. The course finishes with the presentation of various structural types of industrial buildings, analyzing its design and operating principles, the building materials used, and the major construction technologies.

These approaches and objectives are associated with the following Sustainable Development Goals (SDGs) of the United Nations Agenda 2030 (<https://www.un.org/sustainabledevelopment/es/>), in such a way that the subject provides training and competence to contribute to some extent to its achievement:

Objective 9: Industry, innovation and infrastructure (9.1 and 9.2)

1.2. Context and importance of this course in the degree

The optional module of *Instalaciones y Construcciones Industriales* consists of several subjects, for a total of 30 ECTS. Their aim is to train students in the fundamental calculation principles of various industrial facilities, and present the main technologies of industrial construction, the different materials used, and their properties and applications.

Within this optional module, the subject of Industrial Buildings has 6 ECTS, representing one of the five possible subjects to be taken.

This subject constitutes the only option within the optional module to become familiar with aspects related to industrial building. Thus, the subject has been designed as an initial and self-contained approach to the industrial building field, useful for the future professional.

This course is also offered in the Mechanical Engineering degree, which favors the coexistence of different and complementary approaches for the resolution of the technical problems suggested, thus enriching the learning of the students of both degrees.

1.3. Recommendations to take this course

This subject has no prerequisites.

2. Learning goals

2.1. Competences

- Solve problems and make decisions with initiative, creativity and critical thinking.
- Use the techniques, skills and tools of industrial engineering.
- Manage information and implement the technical regulations necessary for the practice of Industrial Engineering.
- Constant learning and developing of independent learning strategies.
- Conceive, design and develop of engineering projects.
- Use specific and integrated knowledge on industrial plants, systems, machines, vehicles, installations, structures; electrical, mechanical, environmental, energy, chemical and manufacturing processes; and industrial electronics, automation and computer tools that control them.
- Apply the acquired knowledge and solve problems of industrial technologies in new and broader contexts.

2.2. Learning goals

1. Knowledge of the construction technology principles and its regulatory codes.
2. Ability to identify materials and elements used in the prefabricated industrial buildings, its properties and applications.
3. Knowledge and understanding of the operation principles of different structures, their adaptation to industrial buildings, and its functional implementation for the business needs.
4. Knowledge of the criteria for selecting an industrial layout and for the arrangement on it, depending on the manufacturing and organizational requirements.

2.3. Importance of learning goals

The professional who has completed the *Ingeniería de Tecnologías Industriales* degree must have a versatile and general training, and ability to meet the challenges that arise in their professional practice. Within this practice, the industrial building sector has a significant influence. Therefore, it is necessary to provide students with general knowledge linked to industrial buildings, enabling the proper performance of their duties.

For this purpose, this course presents a compendium of contents that address from the knowledge and operation of the main technologies and structural types used in the construction of industrial buildings, to the study of the regulations and layout procedures for the manufacturing implementation.

3. Assessment (1st and 2nd call)

3.1. Assessment tasks (description of tasks, marking system and assessment criteria)

The student will be assessed through a progressive assessment mode consisting of:

- Development and defense of a continuous work (portfolio format), carried out throughout the course and which will also include the autonomous resolution of practical cases related to the contents of the subject.

The final grade of the progressive assessment mode will be:

- Portfolio performed throughout the course: 10 points

Non-progressive assessment mode:

Students who choose not to perform the progressive assessment mode will be evaluated by a single global exam at the end of the course (a theoretical and practical test) to be performed on the date established by the academic calendar of the EINA.

4. Methodology, learning tasks, syllabus and resources

4.1. Methodological overview

The course methodology tries to strengthen the continuous work of the student and focuses on the most fundamental design aspects of industrial buildings. For this purpose various teaching methodologies were developed:

- Theoretical knowledge through participatory lecture, given to the entire group in the weekly teaching hours allocated.
- Knowledge application by means of practical classes coordinated with the theoretical advance of the course and supervised by teachers of the subject. These sessions take place in smaller groups to enhance student learning and develop various technical case studies.
- After each practice session, practical work will be required. This practical work will become part of the student portfolio.
- The tutorials will serve to review both the acquisition of theoretical knowledge by the student and his practical work.

To follow the theoretical and practical sessions, the students will have the teaching materials developed by the teachers of

the subject.

4.2. Learning tasks

The learning activities are developed through participatory lectures, practical sessions and tutorial appointments.

4.3. Syllabus

The course will address the following topics:

1. Industrial architecture
2. Industrial buildings
3. Layout
4. Structural models of precast concrete
5. Structural typologies and selection criteria
6. Planning, control and construction of industrial buildings

4.4. Course planning and calendar

The theoretical teaching of the subject will be developed through lectures. The theoretical teaching will be complemented by practices (distributed along the course according to a schedule established by the EINA) and tutored autonomous works. All these activities will be supported through the Moodle application, by using the *Anillo Digital Docente* of the University of Zaragoza.

The dates set for the practice classes and work presentations will be communicated to students at the beginning of the course, and by the Moodle application of the subject, considering the academic calendar for each course center. The non-progressive assessment exam will be held on the date indicated in the academic calendar of the EINA.

Practical works related to the practical sessions and the proposed works will be requested, thus developing the portfolio of the course. The portfolio assessment shall constitute the final mark of the subject (for the progressive assessment mode).

The student must check the dates for conducting practices and presentation of works. It shall be informed of these dates at the beginning of the course and by the *Anillo Digital Docente* application.

The exams (for a non-progressive assessment of the subject), will be held on the dates established by the EINA.
