

Academic Year/course: 2022/23

29810 - Materials Engineering

Syllabus Information

Academic Year: 2022/23

Subject: 29810 - Materials Engineering

Faculty / School: 110 - Escuela de Ingeniería y Arquitectura

326 - Escuela Universitaria Politécnica de Teruel

Degree: 440 - Bachelor's Degree in Electronic and Automatic Engineering

444 - Bachelor's Degree in Electronic and Automatic Engineering

ECTS: 6.0

Year: 2

Semester: First semester

Subject Type: Compulsory

Module:

1. General information

2. Learning goals

3. Assessment (1st and 2nd call)

4. Methodology, learning tasks, syllabus and resources

4.1. Methodological overview

Learning is based on the following activities:

On-site activities: Lectures, group discussion, open discussion in the classroom, problem-solving, case analysis, laboratory sessions in small groups.

Autonomous activities: Reading and viewing of written documents and multimedia material, the study of theory and individual problem-solving. Individual or reduced size group preparation of small courseworks.

4.2. Learning tasks

The course includes the following learning tasks:

Escuela de Ingeniería y Arquitectura (Zaragoza):

Lectures (30 on-site hours)

The topics the syllabus will be developed sequentially in the classroom through the following methods:

Discussion and clarification by the instructor of those concepts included in the readings and previous material that the students show to not have fully understood. Those parts in which students have especial difficulty will be explained together with open discussions in order to integrate the different concepts of the course.

Exercises and case resolution (15 on-site hours)

Exercises will be discussed relative to Materials Engineering, with special emphasis on those in Electronics and Automation Engineering, as well as cases of materials selection within the same technological context.

Laboratory practice sessions (15 laboratory hours)

School of Engineering and Architecture (Zaragoza)

Laboratory work, distributed approximately as two-hour sessions, will cover the following topics:

- Mechanical tests. Treatment of experimental data obtained in the laboratory.

- Mechanical and thermal treatments of alloys.
- Thermal properties of materials.
- Electrical properties of materials.
- Magnetic properties of materials.

University Polytechnic School (Teruel)

- Mechanical tests. Processing of experimental laboratory data. Experimental determination of mechanical properties of materials through different techniques.

Autonomous work and study (85 outside class hours)

It will include the autonomous work of the student with respect to reading and viewing of the provided material, available in the Course Management System, as well as the study of theory and problem-solving.

Evaluation (5 class hours)

Escuela Universitaria Politécnica de Teruel (EUPT):

Lectures (30 on-site hours)

Theory topics will be developed sequentially in the classroom through the following methods:

Discussion and clarification by the instructor of those concepts included in the readings and previous material that the students show to not have fully understood. Those parts in which students have especial difficulty will be explained together with open discussions in order to integrate the different concepts of the course.

Problems and case resolution (18 on-site hours)

Problems will be relative to Materials Engineering, with special emphasis on those in Electronics and Automation Engineering, as well as cases of materials selection within the same technological context.

Laboratory practice (12 in laboratory hours)

Laboratory work, distributed approximately as two-hour sessions, will cover the following topics: Mechanical tests; Processing of experimental laboratory data; Experimental determination of mechanical properties of materials through different techniques.

Assignments (20 outside class hours)

The assignment task will include, among others, the analysis and discussion of the properties of different materials, as well as the consideration of the different experimental techniques used for their determination.

Autonomous work and study (65 outside class hours)

It will include the autonomous work of the student with respect to reading and viewing of the provided material, available in the Course Management System, as well as the study of theory and problem-solving.

Evaluation (5 in class hours)

4.3. Syllabus

This course will address the following topics:

- Atomic organization in solids: Crystalline structure.
- Defects and diffusion: Microstructure.
- Mechanical properties.
- Phase diagrams and phase transformations.
- Thermal properties.
- Electrical properties.
- Magnetic properties.
- Optical properties.
- Metallic materials.
- Ceramic materials.
- Polymer materials.
- Composite materials.

4.4. Course planning and calendar

- Three on-site hours per week.
- Approximately once every two weeks, the student will attend a laboratory session.
- Key dates and deadlines for additional activities (assignments, additional exams) during the lecturing period will be published in due advance.
